4	Partisan Politics in Korea	27

1 Tables

Tables 1 through 4 replicate Tables 2 to 5 from the manuscript, including all control variables and their respective estimates. Table 5 shows OLS regressions without the instrument to illustrate the unobserved confounding problem when not using instrumental variables for inference. Tables 6 to 10 present alternative versions of Table 3 from the main text, incorporating various control variables and fixed effects. Table 11 shows the Two-Stage Least Squares (2SLS) results, examining the link between Confidence in the Local Economy and Approval of Chinese Leadership, as discussed in Footnote 12 of the manuscript. Finally, Tables 12-14 focus on analyses that differentiate between pollution originating from China and local sources, utilizing air pollution data from Ganghwa Island as detailed on page 25 of the manuscript. Table 15 shows results using wind speed and direction as an instrument. Table 16 shows the equivalence test described on page 26. Table 17 shows a robustness test using Germany, Japan, and Russia as placebos. Table 18 shows the mediation analysis by Dippel, Ferrara, and Heblich [2020](#) mentioned on page 23. Finally, Table 19 shows results with rescaled quartile-based measure of Local Economic Confidence Index.

1.1 Manuscript Tables 2 to 5 Including Control Variable Estimates

Tables 1 through 4 replicate Tables 2 to 5 from the manuscript, including all control variables and their respective estimates.

1.6 Using Wind Speed and Direction as Instrument

This analysis uses wind speed and direction as an instrument for air pollution (which is common in the literature). We measure wind direction by quadrants (NorthEast, NorthWest, SouthEast, SouthWest) and wind speed in meters per second. This interaction by itself is not a sufficiently strong instrument. The relationship is context-dependent. For example, in some areas, pollution is higher when wind speed is low (pollution doesn't move), whereas in others, it is higher when wind speed is high. Similarly, the influence of wind direction depends on the origin of the transported pollution. We thus had to interact wind speed and direction with region to get a sufficiently strong first stage ($F=35$). In reality the relationship may be more complex, for example, the link between wind direction, speed, and pollution may differ in summer compared to winter, but that would require a quadruple interaction (for which we don't have sufficient statistical power). We do include a control for month of the year in the first and second stages. Since the first stage is a triple interaction, it would take several pages to display. We thus focus on the second stage.

3 Openness and Transparency and Survey Methodology

Here, we address the limitations related to Openness and Transparency in our study. Our analysis uses the Gallup World Poll microdata. The authors gained licensed access to this data through an agreement with our University library on February 10, 2023. The license agreement stipulates that: "The Licensed User may retain, but not share, the generated subsets of the data files necessary to facilitate work toward publication and any re-analysis in line with original project goals required thereby." We will make available detailed STATA code to replicate the findings from the raw data, which are accessible to researchers who have an affiliation with an institution that has a license agreement with Gallup. In addition, the license agreement stipulates that: "Upon request, Gallup will provide data access to any researcher or research institution performing peer review of any report made by a Licensed User for publication in a peer-reviewed publication." Thus, any researcher who wishes to replicate our findings should be able to do so with our code and a request to Gallup.

Below outlines the methodology employed for each wave of the Gallup Survey conducted in South Korea from 2005 to 2022. It details the dates of the surveys, the number of respondents interviewed, the survey method (including landline and mobile telephone interviews), and the language used.

Year	County	Date	Start	End	Interviews	Mode	Language
2005-2006	South Korea	6-Mar			1,100	Landline Telephone	Korean
2007	South Korea	7-May			1,000	Landline Telephone	Korean
2008	South Korea	Sep 5 - 30-Sep-08	9/5/2008	9/30/2008	1,000	Landline Telephone	Korean
2008	South Korea	Sep 5 - 30-Sep-08	9/5/2008	9/30/2008	1,000	Landline Telephone	Korean

Table 21: Survey Methodology for South Korea

4 Partisan Politics in Korea

To further investigate how partisan dynamics influence public accountability under conditions of trans-boundary air pollution, we analyze variations in the South Korean political context during our study period (2015–2022). This period covers administrations with differing partisan orientations: the conservative administration of President Park Geun-hye (2015–2016), the progressive administration of President Moon Jae-in (2018–2021, explicitly excluding his first and last years to avoid transitional dynamics). Qualitatively, our manuscript documents how leaders across both conservative and progressive parties actively promoted narratives attributing air pollution primarily to China, reinforcing external blame within public discourse (as illustrated earlier in the manuscript).

Empirically, we conducted supplementary analyses interacting respondents’ dissatisfaction with air quality and the incumbent administration’s partisan orientation (coded as “left=1” during the specified Moon administration years and “left=0” otherwise). As shown in Table 22, dissatisfaction with air quality significantly increases dissatisfaction with Chinese leadership under both political contexts. However, dissatisfaction with air quality does not significantly increase dissatisfaction toward the Korean government under either administration type. These findings highlight a consistent pattern: regardless of the incumbent government’s partisan orientation, the public consistently directs blame externally toward China rather than internally toward domestic political authorities. Thus, these empirical results robustly support the “hazy accountability” hypothesis, emphasizing that external blame narratives persist independently of partisan leadership and complicate domestic accountability processes.
